L18 ANSWER 1 OF 2 BIOTECHDS COPYRIGHT 2005 THE THOMSON CORP. on STN
DUPLICATE 1

ACCESSION NUMBER: 2003-06720 BIOTECHDS

TITLE: New peptide from **NADPH oxidase** family,
useful for preparing a pharmaceutical composition for
treating a disease or condition mediated by a human enzyme
protein e.g., Burkitt lymphoma;
human recombinant protein production and its encoding gene
useful for cancer gene therapy

OTHER SOURCE: WPI: 2003-040646 [03]

AB DERWENT ABSTRACT:

NOVELTY - An isolated peptide comprises a 386 residue amino acid sequence (S1), given in the specification or its allelic variant, ortholog or fragment, is new. The allelic variant or ortholog is encoded by a nucleic acid that hybridizes under stringent conditions to the opposite strand of a 1382 or 18853 base pair sequence (S2), given in the specification. The fragment comprises at least 10 contiguous amino acids of (S1).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (1) an isolated antibody that selectively binds to the peptide; (2) an isolated nucleic acid comprising a sequence or its complement that hybridizes under stringent conditions to the opposite strand of the nucleic acid comprising (S2) or encoding the peptide or its allelic variant, ortholog or fragment; (3) a gene chip comprising the isolated nucleic acid of (2); (4) a transgenic non-human animal comprising the isolated nucleic acid of (2); (5) a vector comprising the isolated nucleic acid of (2); (6) a host cell containing the vector of (5); (7) producing the novel peptide, comprising culturing a cell of (6) under expression conditions, and recovering the polypeptide; (8) a method for detecting the presence of the peptide or nucleic acid in a sample; (9) a method for identifying a modulator of, or an agent that binds to, the peptide; (10) a pharmaceutical composition comprising the agent that binds to the peptide and a carrier; (11) a method for treating a disease or condition mediated by a human enzyme protein; (12) a method for identifying a modulator of the expression of the peptide; (13) an isolated human enzyme peptide having a sequence that shares at least 70 % homology with (S1).

BIOTECHNOLOGY - Preferred Peptide: The isolated human enzyme peptide has a sequence that shares at least 70 or 90 % homology with (S1). Preferred Nucleic Acid: The nucleic acid molecule encodes the human enzyme peptide and shares at least 80 or 90 % homology with the nucleic acid having a sequence comprising (S2). Preferred Method: Detecting the presence of the novel peptide in a sample comprises: (a) contacting the sample with a detection agent that specifically allows detection of the presence of the peptide in the sample; and (b) detecting the presence of the peptide. Detecting the presence of the nucleic acid of (2) in a sample comprises: (a) contacting the sample with the oligonucleotide that hybridizes to the nucleic acid under stringent conditions; and (b) determining if the oligonucleotide binds to the nucleic acid in the sample. Identifying a modulator of the novel peptide comprises: (a) contacting the peptide with an agent; and (b) determining if the agent has modulated the function or activity of the peptide. The agent is administered to the host cell. Identifying an agent that binds to the peptide comprises: (a) contacting the peptide with an agent; and (b) assaying the contacted mixture to determine if a complex is formed with the agent bound to the peptide. Treating a disease or condition mediated by a human enzyme protein comprises administering to a patient the agent that binds to the peptide. Identifying a modulator of the expression of the novel peptide comprises: (a) contacting the host cell with an agent; and (b) determining if the agent has modulated the expression of the peptide. Preparation (claimed): Producing the novel peptide comprises: (a) introducing the nucleotide sequence encoding the peptide into the host cell; and (b) culturing the host cell for expression of the peptides from the nucleotide sequence.

ACTIVITY - Cytostatic. is No biological data given.

MECHANISM OF ACTION - Gene therapy.

USE - The peptide is useful for preparing a pharmaceutical composition for treating a disease or condition mediated by a human enzyme protein (claimed) e.g. Burkitt lymphoma. (66 pages)

AB The present invention provides amino acid sequences of peptides that are encoded by genes within the human genome, the enzyme peptides of the present invention. The present invention specifically provides isolated peptide and nucleic acid molecules, methods of identifying orthologs and paralogs of the enzyme peptides, and methods of identifying modulators of the enzyme peptides.
